

Swath Manager

Automatic Boom Section Control

Improve the efficiency of your product applications, decrease operator fatigue and improve application accuracy with Swath Manager. You choose the amount of overlap - 0%, 50% or 100% - and let Swath Manager take over.

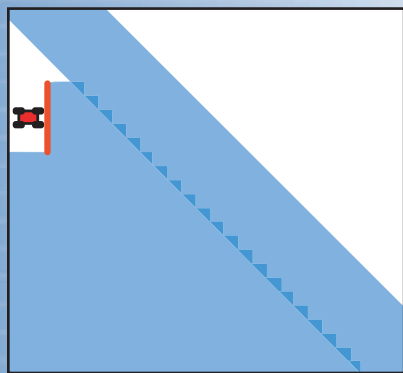

- Boom sections are switched on and off automatically according to preferences.
- Decrease overlaps to reduce product costs and eliminate skips and the need for reapplication.
- Easy manual override option in case you determine a quick change in overlap is required.
- Automatic operation eliminates the guesswork of manual operation of boom section shut off and ensures proper application.

Swath Manager is compatible with the CenterLine lightbar guidance system and can control up to 10 boom sections. An easy and economical upgrade to your standard boom section control. Set-up takes just a few minutes and you're ready to start product application.

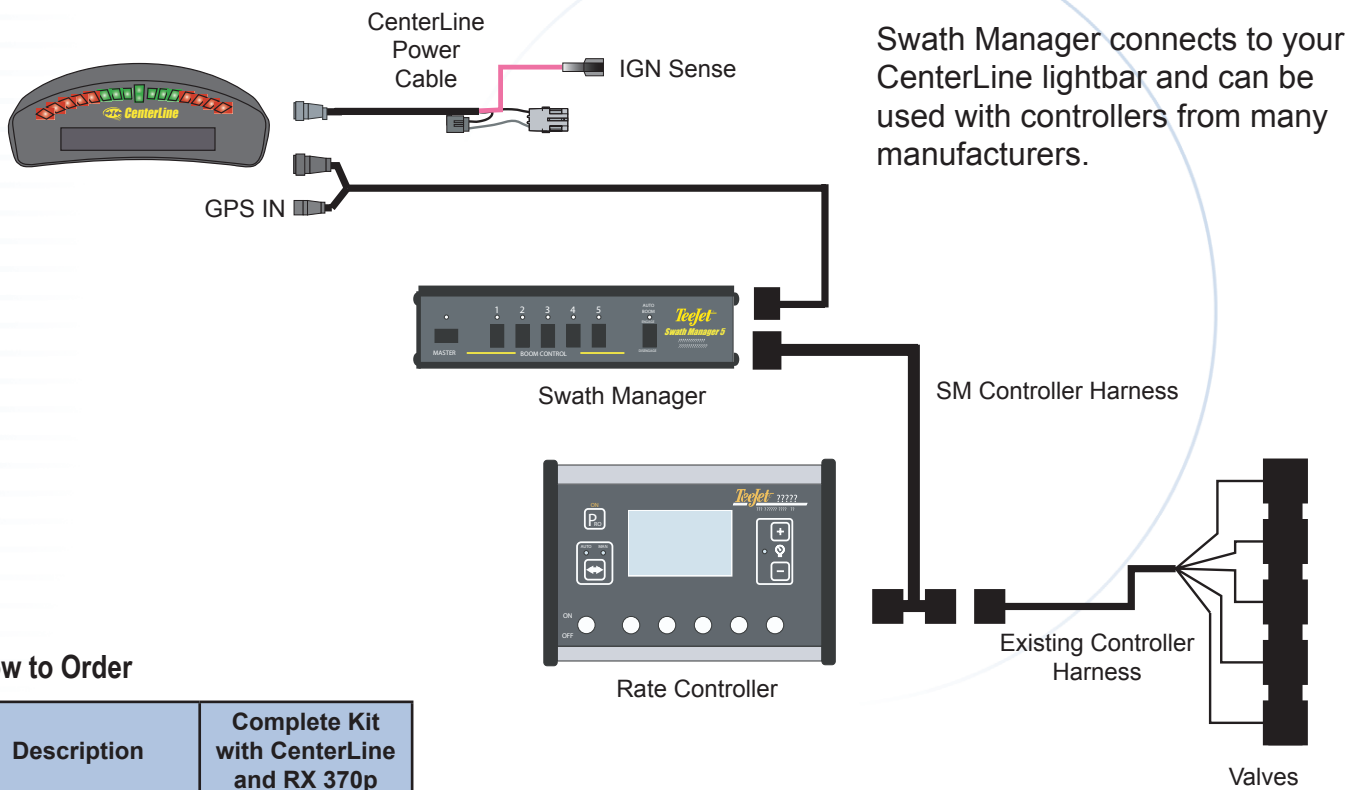

Swath Manager is a component part that requires a CenterLine lightbar and GPS receiver. A SmartPad II mapping device can be added as an upgrade for real time and stored application information. Swath Manager can improve application efficiency and reduce product costs.
